

Intro to Machine Learning

[Final Project: Enron POI Detector](#)> [Project Details](#)[Edit](#)[Github issues](#)[DASHBOARD](#)[CLASSROOM](#)[MATERIALS](#)[DISCUSSION](#)[OVERVIEW](#)

Project Introduction

In 2000, Enron was one of the largest companies in the United States. By 2002, it had collapsed into bankruptcy due to widespread corporate fraud. In the resulting Federal investigation, there was a significant amount of typically confidential information entered into public record, including tens of thousands of emails and detailed financial data for top executives. In this project, you will play detective, and put your new skills to use by building a person of interest identifier based on financial and email data made public as a result of the Enron scandal. To assist you in your detective work, we've combined this data with a hand-generated list of persons of interest in the fraud case, which means individuals who were indicted, reached a settlement, or plea deal with the government, or testified in exchange for prosecution immunity.

Pep Talk

A note before you begin: the projects in the Intro to Machine Learning class were mostly designed to have lots of data points, give intuitive results, and otherwise behave nicely. This project is significantly tougher in that we're now using the real data, which can be messy and doesn't have as many data
